

Here's what you should know about Melamine Dinnerware before you buy:

Melamine dinnerware is widely available and is a popular choice because of its presentation and durability. A popular material for plastic dinnerware since the 1950s, melamine is a hard, thermoset plastic formed from an organic compound rich in nitrogen, carbon and hydrogen that is mixed with formaldehyde. It is scratch-resistant and dishwasher safe, but it cannot be used in the microwave because microwave energy will degrade the material.
